

Serving it Up with Ones and Zeroes

Theresa Berger, Head of Digital Library Services
University of Minnesota

About IIIF

International Image Interoperability Framework (IIIF)

Set of open standards to host and share digitized collections

Standardized model for presenting images and a/v files

Solution for sharing and managing images and metadata

Food for thought

IIIF standard is well-recognized in the digital collections community. By folding this workflow into a IIIF framework, we are supporting interoperability between digital collections and digital objects across institutions

Streamlines the technical process of inserting content notices into digital objects - saving staff time and resources

Code can be easily modified to point to more than one content notice insert if needed (e.g., notices that describe various types of potentially harmful content)

What's next ?

User studies on the wording and design of the insert

More discussion with users and stakeholders on the type of content that should receive this insert

Community shareable plugin (for Blacklight)

A Programmatic Workflow for Inserting Content Notices in Digital Collections

Scott Lawan, Libraries Web Applications Developer
University of Minnesota

Workflow

Pre-Work

Content notice exists in a consumable file format (e.g., JPEG or TIFF) **AND** is stored as a IIIF manifest on an institutional server **OR** as a “placeholder” collection in your Content Management System

E.g. UMN uses CONTENTdm, which automatically generates a IIIF manifest for items uploaded to a collection. We have the notice stored as a placeholder collection

Step One

Item is flagged by staff (archivists, curators, other experts) as needing a content notice

Step Two

Item is uploaded to CMS (e.g. CONTENTdm) with associated metadata. The CMS generates a IIIF manifest for the item

Step Three

Call to update the original item's IIIF manifest with the insert is activated

Our code looks through the item's associated metadata for a specific field and value. (Fig. 2) In this case, we have a true-false field called **Content Notice**, which maps to Additional Description in our DC metadata schema

Step Four

Item is generated on the public-facing digital collections website with the content notice inserted as the first image of the object. (Fig. 3) A new IIIF manifest is generated combining both pieces (the original insert and the digitized object) together
